

Dampness issue in Mobile Holiday Home

Absorbpak were contacted by a Mobile Home Park operating on the East Coast of Ireland during Springtime 2020. As you will be aware, this was during the First Lockdown due to the Pandemic.

Mobile Homeowners were unable to travel down to spring clean and prepare their Holiday Homes for the Summer Season. Some of them expressed concern regarding the possibility of dampness issues and the strong possibility of Mould and fungal growth as a result of this long period without adequate ventilation.

The Operator contacted us, and we undertook a survey at the Mobile Park at the earliest opportunity with adherence to the appropriate Covid guidelines.

A Data logger was installed in one of the affected homes to measure Temperature and Humidity on an Hour-to-Hour Basis. This quickly allowed us to establish the range of climatic conditions occurring over a period of time in the Mobile Home.

In other words How cold and How hot it was getting? and was this causing the dampness issue!!!

Once we collected some data we identified the need to install some of our Product in the mobile homes. We decided to deploy One Absorgel Hanging Blanket which weighed 2 Kgs at the start of the trial.

Within 6 weeks the weight had increased to 3.85 Kgs and 4.8 Kgs by week 12

Problem Solved!!! A simple cost-effective solution to an age old problem, Dampness and Mould growth.
